

## Forklift Fork Positioners

Forklift Fork Positioner - The fork positioner is a hydraulic device that can allow the person driving to operate the lift truck without leaving the seat. They are made out of high quality materials and are intended to withstand the most challenging operations and work surroundings. Side shifting models have the extra ability to be able to laterally position the entire load or the arms in order to facilitate more exact carrying and position in a faster and more effective method.

The blade pocket is rather unique and could enable the one operating it to be able to safely swing the forks into position without any worry of destroying the positioning cylinders. This allows the driver the choice to be able to perform independent or simultaneous fork movement, dependent upon the job requirement. For most lift trucks with non-OEM carriages, complete carriages are considered necessary. Standard OEM carriages can be transformed into blade positioners on existing units.
